UKRAINE FRONTLINE DAILY STRATEGIC INTELLIGENCE REPORT

Integrated quantitative and narrative assessment of open-source information

July 29, 2026

Open sources → semantic and geospatial analysis → strategic indicators → integrated assessment

Purpose of this Report

The report integrates frontline data, territorial changes, combat intensity, FIRMS hotspots, OSINT reporting, unit observations and deep-strike records. Daily, rolling and weekly datasets are treated separately, preventing older or less frequently updated information from being misrepresented as a same-day development.

Data Sources and Freshness

Data block	Frequency	Updated	Status	File
Territorial change	daily	2026-07-28	current	data/territorial_delta.geojson
Long-term summary	daily	2026-07-29	current	data/dashboard_long_term_summary.json
OSINT reporting	daily	2026-07-29	current	data/osint_feed.json
FIRMS 24 hours	daily	2026-07-29	current	data/firms_1.json
FIRMS 30 days	rolling	2026-07-29	current	data/firms_30.json
Unit observations	periodic	2026-07-29	stale	data/unit_feed.json
Deep strikes	weekly	2026-07-29	current	data/manual/ukrajna_oroszorszag_melysegi_csapasok.xlsx

Report at a Glance

2.62 km² Russian daily gains	0.00 km² Ukrainian daily recaptures	+2.62 km² Net change in Russia's favour
12 OSINT items	0 FIRMS hotspots, 24h	9 Weekly deep-strike records
- Most active sector	- Highest threat level	Russian tactical momentum Integrated daily assessment

Executive Summary

The July 29, 2026 dataset identifies 2.62 km² of Russian gains and 0.00 km² of Ukrainian recaptures. The identified daily territorial balance favours Russia by 2.62 km². These figures indicate tactical movement and do not by themselves demonstrate an operational breakthrough.

The long-term summary identifies - as the most active area. The highest indicated threat is associated with -, rated -. Assessment confidence rises when territorial change, event concentration and hotspot patterns point in the same direction.

The daily OSINT feed contains 12 unique items and the 24-hour FIRMS dataset contains 0 hotspots. FIRMS observations are treated as activity indicators rather than automatic confirmation of military events.

The deep-strike section presents the latest complete weekly dataset. It informs the integrated assessment as strategic context but is not presented as activity occurring exclusively on the report date.

Territorial Situation

DATA FREQUENCY: DAILY **LAST UPDATE:** 2026-07-28 **COVERAGE:** -
STATUS: CURRENT - Latest available dataset.

Period	Russian gains (km²)	Ukrainian recaptures (km²)	Net RU (km²)
1 day	2.62	0.00	+2.62
30 days	96.71	51.75	+44.96

Largest identified changes

Side	Area (km²)	Sector	Location
RU	1.95	-	-
RU	0.67	-	-

The daily territorial assessment is based on 2 separate features. The largest changes are not automatically classified as breakthroughs. Operational significance requires persistent movement in the same direction, elevated frontline activity and supporting logistical or deep-strike pressure.

Frontline Activity and Combat Intensity

DATA FREQUENCY: DAILY **LAST UPDATE:** 2026-07-29 **COVERAGE:** -
STATUS: CURRENT - Latest available dataset.

Indicator	Current value
Most active sector	-
Highest-threat sector	-
Threat level	-
Conflict index	0.00
Daily events	12

Event concentration by sector

Sector	Events	Share
General operational area	10	83.3%
Russian rear area	1	8.3%
Ukrainian rear area	1	8.3%

FIRMS Hotspots and Short-Term Activity

DATA FREQUENCY: DAILY LAST UPDATE: 2026-07-29 COVERAGE: -
STATUS: CURRENT - Latest available dataset.

Time window	Identified hotspots
24 hours	0
3 days	0
10 days	0
30 days	0

FIRMS data indicate thermal anomalies. Hotspots may originate from combat, industrial activity, agricultural burning or other heat sources. Their analytical weight rises only when they coincide spatially and temporally with confirmed frontline events, territorial change or credible OSINT reporting.

Deep Strikes - Latest Available Weekly Picture

DATA FREQUENCY: WEEKLY LAST UPDATE: 2026-07-29 COVERAGE: -
STATUS: CURRENT - Latest available dataset.

Date	Location/target	Type	Brief description
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-
-	-	-	-

The section contains 9 records from the latest available weekly dataset. They do not describe the report date exclusively and are used as current contextual evidence.

Units and Force Posture

DATA FREQUENCY: PERIODIC LAST UPDATE: 2026-07-29 COVERAGE: 2026-04-26 - 2026-04-26
STATUS: STALE - Stale dataset; excluded from the integrated daily assessment.

Side / classification	Identified records
Ukraine	1

Sector	Unit records
Donetsk sector	1

OSINT Situation and Daily Drivers

DATA FREQUENCY: DAILY LAST UPDATE: 2026-07-29 COVERAGE: 2026-07-26 - 2026-07-29
STATUS: CURRENT - Latest available dataset.

Integrated Strategic Assessment

The integrated classification is **Russian tactical momentum**. It is driven primarily by the daily territorial balance, event density, 24-hour FIRMS activity, unit-data coverage and - when sufficiently current - the latest weekly deep-strike activity. Main supporting factors: Russian territorial advantage, current weekly deep-strike activity.

24-72 Hour Outlook

- Local territorial movement should be treated as an operational breakthrough only if it persists across successive updates.
- In the most active and highest-threat sectors, watch for spatial concentration of events and pressure spreading to adjacent sectors.

- A sudden rise in FIRMS hotspots is not decisive by itself; coincidence with confirmed strike and frontline reporting is what matters.
- The next weekly deep-strike update may alter the assessment of logistical and rear-area pressure.

Methodology and Limitations

1. Data collection

The report uses only open-source datasets available in the repository. A missing file is not automatically interpreted as a zero value.

2. Data freshness

Each block has its own update frequency. Daily data receive a short tolerance; weekly deep-strike data are current at 0-7 days, reduced-weight at 8-14 days and stale beyond 14 days.

3. Territorial change

Aggregated km² values derived from GeoJSON polygons indicate tactical territorial movement. Geometric accuracy and source timing constrain the result.

4. OSINT and event density

Events are deduplicated by URL or title. Quantity does not equal military significance, so the report prioritises higher-importance and spatially concentrated observations.

5. FIRMS

Thermal anomalies are not automatically military events. They increase confidence only when supported by other data sources.

6. Unit observations

Unit data represent the last known observations. Missing data do not prove that a unit is absent or static.

7. Deep strikes

data/manual/ukrajna_oroszország_melysegi_csapasok.xlsx is updated weekly. The PDF displays its coverage period and never automatically labels all records as same-day events.

8. Integrated classification

The summary classification is an indicator framework rather than a probability model. It combines daily territorial balance, event density, hotspots, unit observations and sufficiently current weekly context.

9. Uncertainty

The frontline can change rapidly. Sources may be delayed, contradictory or incomplete. This report does not replace primary military intelligence.

Legal and Methodological Disclaimer

This report is an open-source analytical product. It is not military, investment, legal or official government advice. The author and Törésvonalak do not guarantee that individual sources are complete or error-free.
